

Exercise 7

Samba

Announced Date: 2004/12/27

Due Date: 2004/1/8

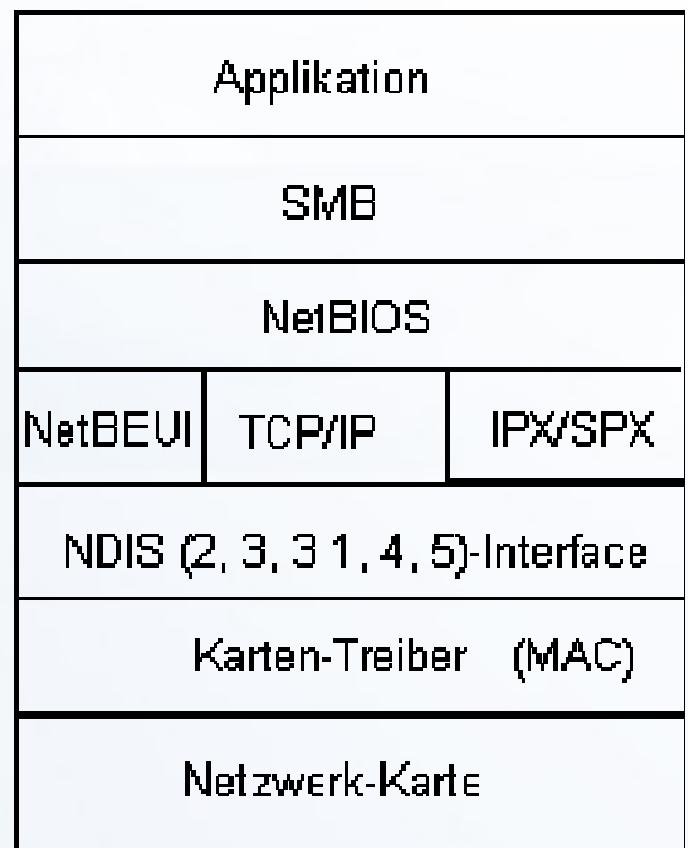

Network-based File Sharing (1)

> NFS (UNIX-based)

- mountd is responsible for mount request
- nfsd and nfsiod

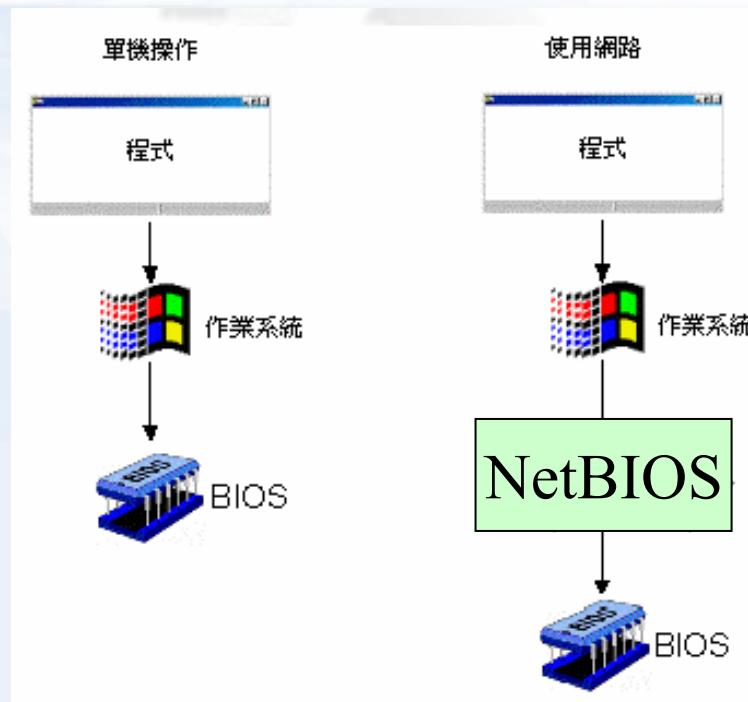

> CIFS (Microsoft)

- Common Internet File System
- 網路芳鄰

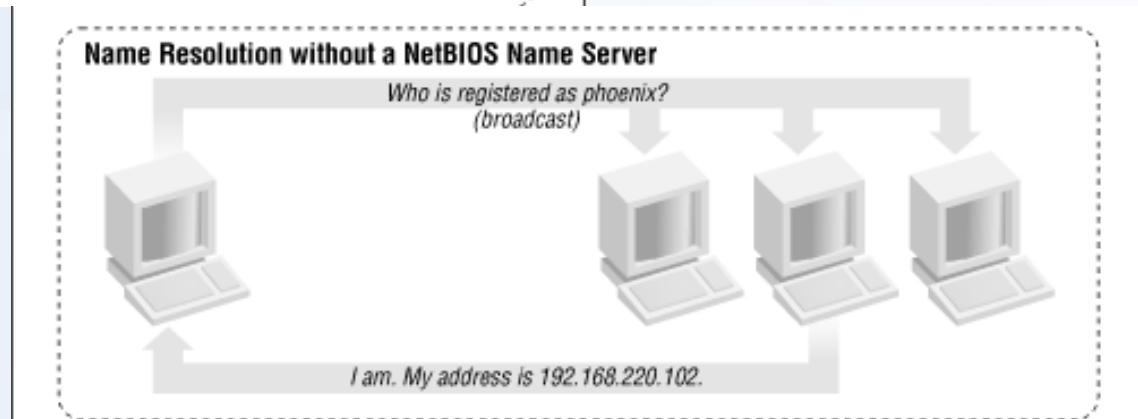

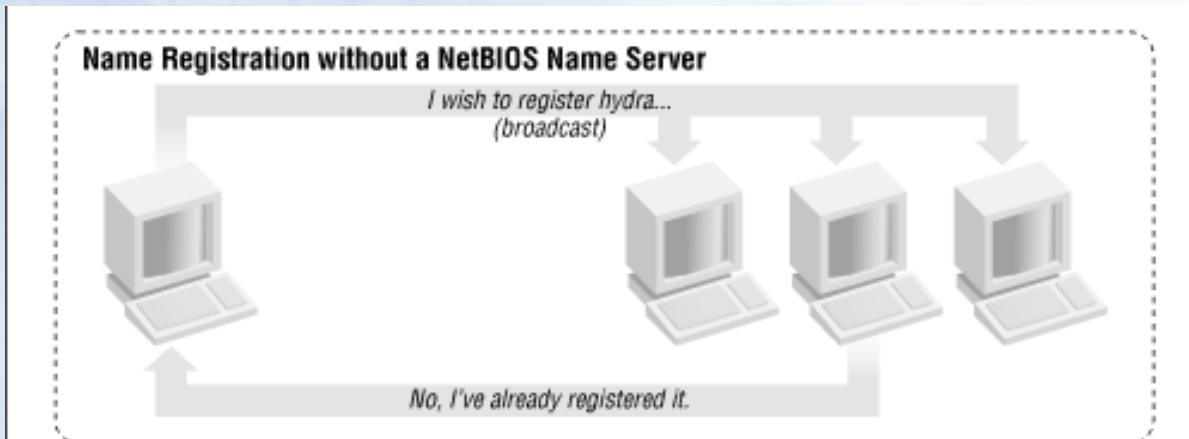

Network-based File Sharing (2)

- > Difference between local filesystem and network filesystem when accessing
 - NetBIOS (API)
 - Used to share or access network-based filesystem just as BIOS does in local filesystem

Network-based File Sharing (3)

- NetBEUI (transport protocol)
 - Transfer NetBIOS commands across network
 - Each host can claim a name not used in network
 - > NetBIOS Name Server or not

Network-based File Sharing (4)

Name Registration with a NetBIOS Name Server

I wish to register hydra...

No, someone has already registered it.

Name Resolution with a NetBIOS Name Server

Who is registered as phoenix?

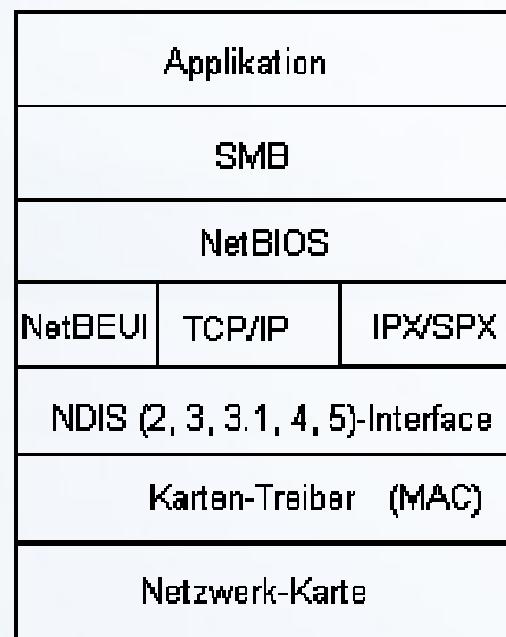

That name currently belongs to 192.168.220.102.

UNIX-Windows communication

> SAMBA

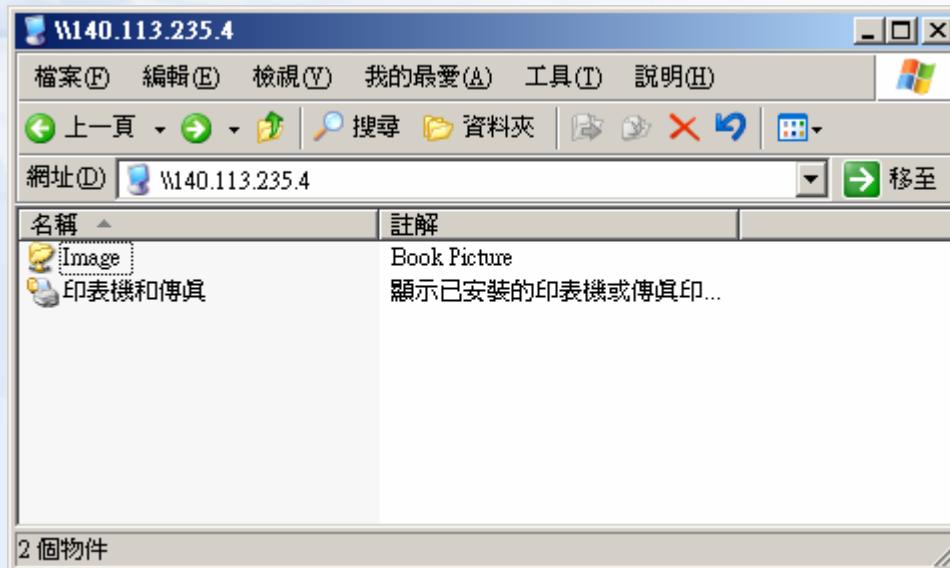

- A UNIX application that speak SMB protocol
- Designed by Andrew Tridgwell, in 1991
- Original Name: Server Message Block (SMB)

What SAMBA can do?

> Sharing

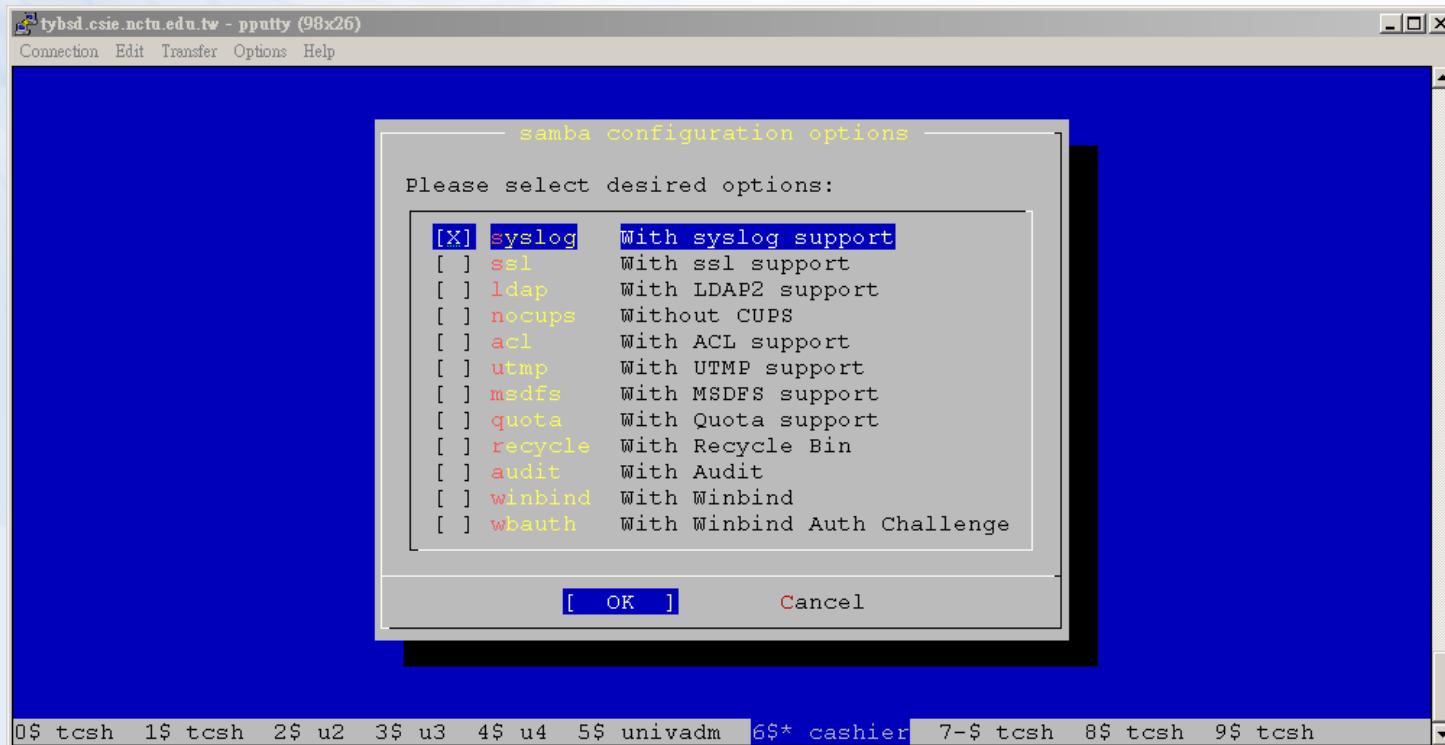

- Sharing files or printers just like Microsoft does
- Authenticate user identity just like Microsoft does
- Resolve NetBIOS name just like Microsoft does

Install SAMBA

> Using ports

- % cd /usr/ports/net/samba
- % make; make install; make clean

SAMBA components

> Configuration files

- /usr/local/etc/smb.conf.default → /usr/local/etc/smb.conf
- /usr/local/etc/lmhosts

> Major execution files

- Under /usr/local/samba/bin directory
- smbd
 - Management of sharing directories, files and printers
- nmbd
 - Resolve NetBIOS name and manage workgroup
- smbpasswd
 - Change a user's SMB password

SAMBA configuration file

> `smb.conf`

- Three sections

- Global Setting
- Printer Sharing Setting
- Home Sharing Setting

SAMBA configuration file – Global Setting (1)

> Global Configuration

- **workgroup**
 - Group name to join
 - Ex: workgroup = tytsai
- **server string**
 - Description of this host
 - Ex: server string = TYTSAI SAMBA SERVER
- **netbios name**
 - NetBIOS name of this host
 - Ex: netbios name = tybsd
- **client code page**
 - Which codepage.XXX files to load
 - Ex: client code page = 950
- **hosts allow**
 - Apply to all services, regardless or individual service setting;
 - Ex: hosts allow = 140.113.235. , 140.113.

SAMBA configuration file – Global Setting (2)

- **guest ok**
 - If this is yes, no password is required
 - Ex: guest ok = no
- **guest account**
 - If guest can use this samba service, any guest request will map to this guest account
 - Ex: guest account = ftp
- **log file**
 - Full path of log file
 - Ex: log file = /var/log/samba/log.%m
- **max log size (KB)**
 - Ex: max log size = 500

SAMBA configuration file – Global Setting (3)

- **security = [share/user/server/domain]**
 - share: no need of id and password to login
 - user: default option, login with id and password
 - server: check id and password by another server
 - domain: check id and password by domain controller
- Ex:
 - > security = user
 - > encrypt passwords = yes
 - > smb passwd file = /usr/local/samba/private/smbpasswd

SAMBA configuration file – Global Setting (4)

> Example of global setting

```
[global]
workgroup = tytsai
server string = tybsd samba server
netbios name = tybsd
client code page = 950
printcap name = /etc/printcap
load printers = yes
printing = lprng
log file = /var/log/samba/log.%m
max log size = 500
security = user
encrypt passwords = yes
smb passwd file = /usr/local/samba/smbpasswd
```

Samba parameters

> Default parameters in samba

- **%m**
 - Client NetBIOS name
- **%M**
 - Client Hostname
- **%I**
 - Client IP
- **%L**
 - Samba server NetBIOS name
- **%h**
 - Samba server Hostname
- **%H**
 - User home directory
- **%U**
 - Login name
- **%T**
 - Current Date time

SAMBA configuration file – Home Sharing Setting (1)

> Home sharing setting

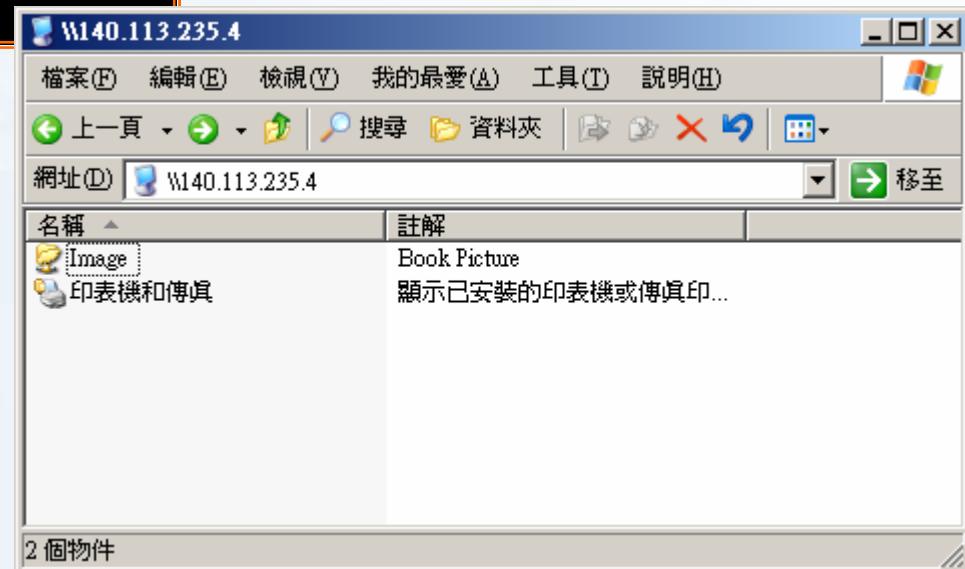

- **comment**
 - Description of this directory
- **path**
 - Sharing directory path
- **browsable**
 - Display sharing name or not
- **read only , writeable**
- **write list**
 - Only users on this can write content if read only
- **create mode / create mask**
 - Default permission when file is created
- **directory mode / directory mask**
 - Default permission when directory is created
- **guest ok**

SAMBA configuration file – Home Sharing Setting (2)

> Example of home sharing

[Image]

comment	= Book Picture
path	= /home/image
read only	= no
public	= yes
writable	= yes
create mode	= 0664
directory mode	= 0775

Starting SAMBA

> Script

- `/usr/local/etc/rc.d/samba.sh {start|stop}`

SAMBA password (1)

> smb password file

- Path can be defined in smb.conf

- % cd /usr/local/samba/private
- % sudo touch smbpasswd
- % sudo chmod 600 smbpasswd

SAMBA password (2)

> smbpasswd command

— -a

- Add new user

— -d

- Let some account in smbpasswd file can not login

— -e

- Let some disable account resume

```
tytsai@tybsd:/<2>samba/private> sudo cat smbpasswd
tytsai:1001:EE8266490C3E780CF7E62F36F8DB5AE6:57369E62E0B36835FBCDA752A590BB82
:[U      ]:LCT-419332AE:
tytsai@tybsd:/<2>samba/private> sudo /usr/local/samba/bin/smbpasswd -a chiaming
New SMB password:
Retype new SMB password:
Added user chiaming.
tytsai@tybsd:/<2>samba/private> sudo cat smbpasswd
tytsai:1001:EE8266490C3E780CF7E62F36F8DB5AE6:57369E62E0B36835FBCDA752A590BB82
:[U      ]:LCT-419332AE:
chiaming:1002:C3F8E2488DF0D9CD09752A3293831D17:39E635B42A40D6F73E0A963BD8ABC0A9
:[U      ]:LCT-41D0113A:
```

Tool: smbclient (1)

- > A client program that can talk to an SMB server
- > Usage:
 - **-L [hostname]**
 - List sharable resource
 - **-U [username]**
 - Login with username

Tool: smbclient (2)

```
tytsai@tybsd:/<2>samba/bin> ./smbclient -L tybsd -U tytsai  
Password:  
Domain=[TYBSD] OS=[Unix] Server=[Samba 3.0.7]
```

Sharename	Type	Comment
-----	---	-----
Image	Disk	Book Picture
IPC\$	IPC	IPC Service (tybsd)
ADMIN\$	IPC	IPC Service (tybsd)

```
Domain=[TYBSD] OS=[Unix] Server=[Samba 3.0.7]
```

Server	Comment
-----	-----

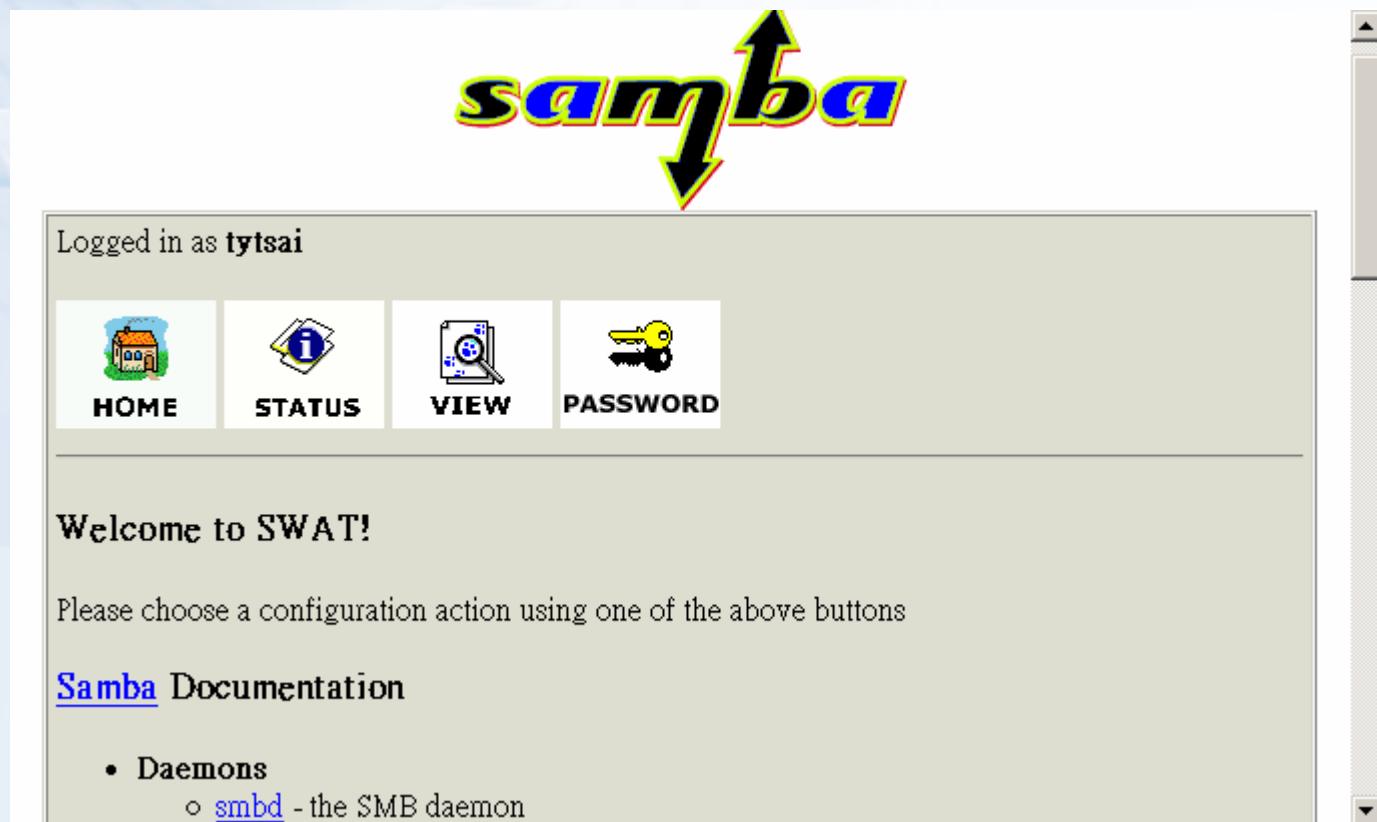

Workgroup	Master
-----	-----

SWAT (1)

> Edit /etc/inetd.conf

— Unmark

```
swat    stream  tcp    nowait/400    root    /usr/local/sbin/swat    swat
```

SWAT (2)

> Root access

The screenshot shows the SWAT (Samba Web Administration Tool) interface. At the top, there is a logo consisting of the word "samba" in a stylized font where each letter has a different color and outline. Below the logo is a horizontal menu bar with the following buttons: HOME, GLOBALS, SHARES, PRINTERS, WIZARD, STATUS, VIEW, and PASSWORD. The "WIZARD" button is highlighted with a yellow arrow pointing down to it from the "samba" logo above. The main content area of the page displays the following text:

Welcome to SWAT!

Please choose a configuration action using one of the above buttons

[Samba Documentation](#)

- **Daemons**
 - [smbd](#) - the SMB daemon
 - [nmbd](#) - the NetBIOS nameserver
 - [winbindd](#) - the winbind daemon
- **Configuration Files**
 - [smb.conf](#) - the main Samba configuration file
 - [lmhosts](#) - NetBIOS hosts file

Exercise Requirement

Requirements

- > Install samba
- > Create three sharing
 - [secret]
 - Shared directory, require login
 - [public]
 - Shared directory, guest ok
 - [invisible]
 - Invisible directory, must type directory
